Discussion of "Credit risk transfer in banking markets with hard and soft information" by Hakenes & Schnabel

Florian Heider European Central Bank Financial Research

- Cost and benefit of buying insurance against loan default
 - allows to fund more profitable but risky projects
 - Insurer cannot observe loan quality so it sets average price → bank has incentive to insure very low quality loans
- Bank use profits from high quality loans to subsidize lower quality loans
 - competition erodes profits from high quality loans

The mechanics of the model

Bank assets (loan portfolio) are risky

Some observations

- Two-point support: debt or equity?
- Soft" vs "hard" information or "complete" vs "incomplete" information?
 - insurer knows/doesn't know the quality of the loan
- Can insurer screen loan quality?
 - asking for collateral, different probability of obtaining insurance, partial insurance
- Insurer is not constrained to not default
 - \blacklozenge in practice risk was less distributed than it was assumed \rightarrow who can bear long-term risk?
- More competition leads to more bad loans
 - ◆ but more competition reduces adverse selection insurance premium → market break down less likely

A comment on modeling asymmetric info about risk

- Project qualities are ordered by First-Order Stochastic Dominance
 - distribution F dominates G if $F(x) \le G(X)$

⇒ Any investor chooses *F* over *G* independent of her attitude to risk

How constrained are banks? They hold a lot of equity

Sample: top 100 US and top 100 EU publicly traded banks 1991-2004 (Gropp & Heider, 2007)

Riskier banks hold more equity (to expand capacity?)

Controls: size, profits, market to book, collateral, dividends, year & country FE
