Small, open and commodity exporting economies are subject to large foreign shocks, like commodity prices or international interest rates.

イロト 不得下 イヨト イヨト 二日

- Small, open and commodity exporting economies are subject to large foreign shocks, like commodity prices or international interest rates.
- In good times risk premia shrinks, credit booms, economic activity picks up and the real exchange rate appreciates.

イロト イポト イヨト イヨト 二日

- Small, open and commodity exporting economies are subject to large foreign shocks, like commodity prices or international interest rates.
- In good times risk premia shrinks, credit booms, economic activity picks up and the real exchange rate appreciates.
- Not much is known about how monetary and macroprudential policies cope with foreign shocks in a commodity exporting economy.

- Small, open and commodity exporting economies are subject to large foreign shocks, like commodity prices or international interest rates.
- In good times risk premia shrinks, credit booms, economic activity picks up and the real exchange rate appreciates.
- Not much is known about how monetary and macroprudential policies cope with foreign shocks in a commodity exporting economy.
- We estimate a model to bring it into a policy environment. We use the model to assess the benefits and the costs of conventional and unconventional policy instruments in the face of foreign shocks.

Large increases in oil prices

Oil shock \equiv the maximum value of the oil price during the last 36 months. It occurs when the oil price change is larger than two std. deviations, Hamilton (2003).

- Capital is specific to both T and NT sectors, labor can move freely between sectors.
- Key: financial accelerator (BGG) in *both sectors* where net worth is influenced by valuation effects.

Key 1: Financial accelerator tradable and nontradable (j = N, T)

 Perfectly competitive banks make commercial loans to entrepreneurs, *b*^j_t, by taking deposits from households, *d*_t, and borrowing from international financial markets, *b*^{*}_t.

Key 1: Financial accelerator tradable and nontradable (i = N, T)

- Perfectly competitive banks make commercial loans to entrepreneurs, b^j_t, by taking deposits from households, d_t, and borrowing from international financial markets, b^{*}_t.
- Financial intermediation subject to frictions (CSV problem) on the side of the asset side of the banks. Thus, spreads depend on firms' net worth, n^j_t and the value of capital, p^{kj}_t k^j_t.

$$\mathbb{E}_t\left[r_{t+1}^{k^j}\right] = \left(\frac{n_t^j}{p_t^{k^j}k_t^j}\right)^{-v_t^j} (1+r_t)(rp_t)$$

► We define a "regulation premium", *rp_t*, as *any* policy that increases credit costs.

Key 2: Conventional and unconventional tools

► Monetary policy rule: reacts to deviations of *total* inflation relative to the target π

$$\dot{i}_t = \dot{i}_{t-1}^{
ho_i} \left(\bar{i} \left(\frac{\pi_t}{\overline{\pi}} \right)^{\varphi_{\pi}} \right) \exp \left(\varepsilon_t^{\mu} \right)$$

González et al. (2014)

González et al. (2014)

Macro-prudential policies

Key 3: Oil production and country risk

Changes in oil revenues are ultimately transferred to households, relaxing their budgets. In addition, oil affects the country risk premium:

$$(1+i_{t}^{*}) = (1+\bar{r}^{*})(1+\pi_{t}^{*})z_{t}^{i^{*}}\frac{\exp\left(v_{b^{*}}\left(\frac{q_{t}b_{t}^{*}}{GDP_{t}}-\bar{b}^{*}\right)\right)}{\exp\left(v_{oil}\left(oil_{t}-\overline{oil}\right)\right)}$$

The value of oil activities is exoegenous

$$\textit{oil}_t =
ho_{z^{oil}}\textit{oil}_{t-1} + (1 -
ho_{z^{oil}})\log\left(\overline{\textit{oil}}\right) + arepsilon_t^{oil}$$
