BIS global liquidity indicators: methodology

The term "global liquidity" is used by the BIS to mean the ease of financing in global financial markets. Credit is among the key indicators of global liquidity and the focus of the global liquidity indicators (GLIs) constructed by the BIS (Domanski et al (2011)). Global liquidity in general and credit in particular influence the build-up of financial system vulnerabilities in the form of asset price inflation, leverage, or maturity or funding mismatches (Caruana (2014)).

The BIS global liquidity indicators (GLIs) track credit to non-bank borrowers, covering both loans extended by banks and funding from global bond markets through the issuance of international debt securities (<u>IDS</u>). The main focus is on foreign currency credit denominated in three major reserve currencies (US dollars, euros and Japanese yen) to non-residents, ie borrowers outside the respective currency areas. The GLIs monitor growth in this credit relative to that denominated in those same currencies to residents within these currency areas.

These indicators draw on national data and BIS international banking and financial statistics, but incorporate assumptions and estimations by BIS statisticians. Borrowers are grouped based on the country in which they reside; accordingly, what constitutes foreign currency is defined from the perspective of the borrower country. The methodology behind each of the indicators is explained below.

The BIS GLIs are constructed quarterly and published concurrently with the <u>BIS</u> <u>Quarterly Review</u>. They can be viewed and downloaded in the BIS Statistics Explorer (<u>stats.bis.org/statx/toc/GLI.html</u>) and through the BIS Statistics Warehouse (<u>stats.bis.org/bis-stats-tool</u>).

The term "country" as used in this document also covers territorial entities that are not states as understood by international law and practice but for which data are separately and independently maintained.

Questions about the GLIs may be addressed to statistics@bis.org.

1. Assessing global liquidity conditions

The interaction of private and official factors determines the economy's overall ease of financing. For instance, financial institutions provide market liquidity to securities markets through their trading activities, and provide funding liquidity to borrowers through their lending activities. The terms on which these intermediaries can fund themselves depend on the willingness of other market participants to interact with them. Prudential and macroeconomic policies, including the conditions under which central banks provide funding to the financial system, will affect these interactions (Eickmeier et al (2013)).¹

The outstanding amount of credit shows how far the ease of financing has led to a build-up of exposures. In other words, credit to private sector borrowers reflects the outcome of financial intermediation in global markets. Unusually rapid changes in outstanding credit are associated with the build-up of vulnerabilities, with potential implications for financial stability. Much of this credit, although not all, is provided by banks, so the BIS indicators focus primarily on bank credit.

Of particular interest for the assessment of global liquidity is the international component of credit, in the form of cross-border lending and local lending denominated in foreign currencies. This is because the international component often provides the marginal source of financing in the run-up to financial crises. Although the international component is often small relative to total credit, swings in this

¹ For analysis and research about global liquidity, see the references listed under "More information" at <u>www.bis.org/statistics/gli.htm</u>.

component can amplify domestic trends and are highly correlated with booms and busts in global financial conditions.

Any assessment of global liquidity conditions requires that measures of global credit be put into perspective. Moreover, the informativeness of indicators changes over time, implying that a flexible and multifaceted approach is needed when assessing global liquidity conditions (Committee on the Global Financial System (2011)). A range of supplementary price and quantity indicators can be used to capture additional specific aspects of global liquidity that are relevant for financial stability. These include measures of financing conditions in key financial markets and incentives for position-taking across market segments. These indicators tend to include proxies for risk appetite, which is a major driver of leverage and the willingness of private investors to provide funding.

2. Banks' claims

Table E1 (stats.bis.org/statx/srs/table/e1)

2.1 Banks' international claims

International claims are defined as banks' cross-border claims denominated in all currencies plus their local claims denominated in foreign currencies:

|--|

where	INTC _{s,t}	= banks' international claims on sector s at time t;
	$XBC_{s,t}$	= banks' cross-border claims on sector s at time t;
	$LCFX_{s,t}$	= banks' local claims in foreign currencies on sector s at time t .

Claims refer to banks' financial assets: loans, holdings of debt and equity securities, derivatives and other financial instruments. Data are from the BIS locational banking statistics (LBS) and exclude the claims of banks located in countries that do not report the LBS.²

 $INTC_{s,t}$ is calculated for all counterparty sectors in aggregate as well as for two individual counterparty sectors s: banks and non-banks. The non-bank sector comprises non-financial corporations, general government, households and non-bank financial institutions. Claims on the bank sector include banks' positions vis-à-vis affiliates within the same banking group. Claims on all sectors include claims on non-banks, banks and claims unallocated by sector.

Table E1 shows banks' outstanding international claims as a percentage of GDP and their annual percentage change (calculated as explained in section 4). The level of international claims is scaled by global GDP from the latest IMF *Word Economic Outlook*. In order to calculate series with quarterly frequencies, annual GDP data are linearly interpolated.

For further information on the locational banking statistics, see <u>www.bis.org/statistics/about banking stats.htm</u>. For a list of LBS-reporting countries, see <u>www.bis.org/statistics/rep countries.htm</u>.

2.2 Banks' total claims on the private non-financial sector

Banks' total claims on the private non-financial sector (PNFS) are the sum of their local claims and cross-border claims in all currencies. The PNFS is composed of non-financial corporations and households. Local claims are obtained from BIS series on bank credit to the non-financial sector (CNFS).³ Cross-border claims are obtained from the LBS; they include claims on the non-bank financial and government sectors, in addition to the PNFS, ie cross-border claims refer to claims on the non-bank sector (affording broader statistical coverage).

For LBS-reporting countries, growth of local claims in all currencies from the CNFS series are adjusted for exchange rate movements by combining them with local claims in foreign currency from the LBS as follows:

 $local claims adjusted growth_{i,t} = \frac{\Delta\left(\left(lcusd_{i,t} - lcfcs_{i,t}\right) * xr_{end_{i,t}}\right) + lcfcf_{i,t} * xr_{avg_{i,t}}}{lclc_{i,t-1}}$ (2)

where *i* indicates the country and *t* the quarter;

lcusd = local claims expressed in US dollars, converted at end-of-period US dollar bilateral exchange rate (from BIS CNFS);

lclc = local claims expressed in local currency (from BIS CNFS);

- *lcfcs* = local claims in foreign currency expressed in US dollars, amounts outstanding (from BIS LBS);
- *lcfcf* = local claims in foreign currency expressed in US dollars, exchange rate and break-adjusted changes (from BIS LBS);
- *xr*_{end} = end-of-period US dollar bilateral exchange rate;
- *xr*_{avg} = average-of-period US dollar bilateral exchange rate.

Annual percentage changes are calculated using the local claims adjusted flow for each LBS reporting country.For non-LBS-reporting countries, local claims are assumed to be denominated in the local currency (hence, no adjustment is made for local claims in foreign currencies). For these countries, annual percentage changes are calculated based on simple changes in stocks.

Table E1 and Graph E2 show banks' total claims by region, as defined in Table 1 below. Regional averages are weighted by countries' GDP, where GDP is a fourquarter moving sum.

³ For further information on the BIS credit series, see <u>www.bis.org/statistics/totcredit.htm</u>.

Countries included in banks' total claims on the private non-financial sector						
Region (number of countries) Countries included in region						
All countries (43)	All countries listed below plus United States	5J

3. Total credit to non-bank borrowers by currency of denomination

US dollar	Table E2.1 (stats.bis.org/statx/srs/table/e2?m=USD)
Euro	Table E2.2 (<u>stats.bis.org/statx/srs/table/e2?m=EUR</u>)
Japanese yen	Table E2.3 (<u>stats.bis.org/statx/srs/table/e2?m=JPY</u>)

Total credit by currency of denomination is composed of credit extended by all (foreign and domestic) lenders. Specifically, it is composed of loans extended by banks and purchases of debt securities by both banks and non-banks (as proxied by issues of debt securities).

For each currency, total credit can be decomposed into credit to residents of countries for which the selected currency is domestic (*credit to residents*) and credit to residents of countries for which the selected currency is foreign (*credit to non-residents*). For example, for the US dollar series, *credit to residents* refers to US dollar-denominated credit to US residents and *credit to non-residents* refers to US dollar-denominated credit to borrowers residing outside the United States.

 $Total \ credit_{c,t} = Credit \ to \ residents_{c,t} + credit \ to \ non-residents_{c,t}$ (3)

where c is the currency of denomination (USD, EUR or JPY) and t is the quarter.⁴

A breakdown of credit to non-residents by borrowing location is calculated for emerging market economies (EMEs), as a total and separately for the four main EME regions. In addition, country-level foreign currency credit (FCC) is published for selected EMEs. For a detailed overview of the FCC components by country and currency, see annex A.

⁴ All amounts are expressed in the respective currency of denomination.

3.1 Total credit to non-residents

Credit to borrowers outside the currency-issuing jurisdiction consists of three main components: international debt securities (*ids*), cross-border bank loans (*xbl*) and locally-extended bank loans in foreign currency (*llfx*).

$$credit \ to \ non-residents_{i,c,t} = ids_{i,c,t} + xbl_{i,c,t} + llfx_{i,c,t}$$
(4)

where i indicates the borrower location, c the currency of denomination (USD, EUR or JPY) and t the quarter.

The BIS international debt securities statistics (IDSS) allow for a breakdown by sector into banks, non-bank financials and non-financials. Graph E3 shows debt securities issued by non-residents in the non-financial sector. Table E2.1–3 includes non-resident issuance of debt securities for the non-bank as well as the non-financial sector. For the IDS used in the GLIs, the country is assigned based on the residency of the issuer.

$$ids \ nb_{i,c,t} = ids \ nbf_{i,c,t} + ids \ nf_{i,c,t}$$
(5)

where

ids nb = international debt securities issued by non-banks;

- ids nbf = international debt securities issued by non-bank financial institutions (immediate issuer sector);
- *ids nf* = international debt securities issued by non-financial entities (immediate issuer sector).

For IDS issued in US dollars, US dollar-denominated issuance in the Cayman Islands by US-based entities is excluded on the assumption that this represents credit to US residents. For IDS issued in euros, the issuance of the European Financial Stability Facility (EFSF), the European Financial Stabilisation Mechanism (EFSM) and the European Stability Mechanism (ESM) are excluded.

The bank loans data come from the LBS and refer to loans to the non-bank sector, including non-bank financial institutions.⁵

The cross-border component is directly taken from reported LBS data. In addition, global US dollar credit to non-residents includes national data on crossborder loans from banks in China for the period Q1 2010 to Q3 2015, before China became an LBS-reporting country.⁶

For (global and regional) local loans in foreign currency (llfx), LBS reported local loans (rllfx) are supplemented with national data (ndllfx), an estimate for non-reporting countries (*nonrepllfx*) and an estimate for newly reporting countries (*newrepllfx*).

$$llfx_{i,c,t} = rllfx_{i,c,t} + ndllfx_{i,c,t} + nonrepllfx_{i,c,t} + newrepllfx_{i,c,t}$$
(6)

where*rllfx*= LBS reported local loans;*ndllfx*= national data on local loans. This only applies to US dollar
loans in Argentina and China, see below;

⁶ Between 2010 Q1 and 2015 Q3, the global US dollar aggregate includes 80% of overseas loans from the People's Bank of China's *Sources & uses of credit funds of financial institutions (in foreign currency)* table.

⁵ Bank loans for which the country of the borrower is unallocated are included in global credit to nonresidents.

nonrepllfx = estimated local loans, proxied by cross-border loans to banks of non-reporting economies and economies not reporting local loans in the LBS;
 newrepllfx = estimated local loans for new reporters (ie countries that started reporting after 2000) for the period before they started reporting. The estimates are obtained by multiplying cross-border loans to banks by the minimum of (i) the average ratio for the first four reported quarters of local loans to non-banks to cross-border loans to banks and (ii) 1.00. Thus, if the above ratio exceeds 1.00, the new reporter estimate follows the same

The *llfx* component of individual country-level FCC data only includes LBS-reported (*rllfx*) and nationally reported (*ndllfx*) local loans. For Argentina and China, local loans in US dollar are from national data on foreign currency loans and are assumed to be 100% and 80%, respectively, in USD.

methodology as the non-reporter estimate.

3.2 Total credit to residents

Credit to residents in currency *c* is defined as credit to the non-financial sector(s) of the jurisdiction for which currency *c* is the domestic currency. Total credit to residents is taken from the national flow of funds (FoF), then adjusted to exclude credit to resident borrowers in non-domestic currencies (ie cross-border and locally extended loans and outstanding international bonds in foreign currencies). The LBS and IDSS are used to adjust for non-domestic currencies.

 $credit to residents_{c,t} = credit_{all,t} - lf x_{all-c,t} - df x_{all-c,t}$ (7)

where

(from FoF) lfx = cross-border and locally extended loans to non-banks in foreign currency (from LBS)⁷

credit = credit to the non-financial sector in the currency-issuing jurisdiction

dfx = debt securities issued by the non-financial sector in foreign currency (from IDSS)⁸

Tables E2.1–3 also show series on credit to the government, based on national FoF data.

- ⁷ $lf x_{c,t} = loans in all currencies in issuing jurisdiction loans in own currency in issuing jurisdiction.$
- $df x_{c,t} = ids$ in all currencies in issuing jurisdiction -ids in own currency in issuing jurisdiction.

4. Annual percentage changes

Annual growth rates are computed by first using exchange rate- and break-adjusted changes to calculate a quarterly growth rate, and then compounding quarterly growth rates over four quarters.

Annual growth_t = 100 ×
$$\left(\prod_{k=0}^{3} \left(\frac{BEC_{t-k}}{AO_{t-k-1}} + 1\right) - 1\right)$$
 (8)

where B

BEC = break- and exchange rate-adjusted changesAO = amount outstanding

This formula isolates changes in outstanding amounts arising from transactions from changes arising from other factors (European Central Bank (2012)). For IDS, adjusted changes refer to the net issuance of debt securities, ie gross issuance minus redemptions.

FX = foreign currency; IDS = international debt securities issued by non-banks in the borrowing country; LC = Local claims; LL = local loans; NB = non-bank sector; XBC = cross-border claims; XBL = bank loans from the rest of the world to the non-bank sector of the borrowing country.

¹ Banco Central de la República Argentina, Bank assets, loans to non-financial sector in foreign currency. ² People's bank of China, Sources & Uses of Credit Funds of Financial Institutions (in foreign currency), domestic loans.

Annex B: Revisions and breaks

The GLIs are subject to changes arising from revisions to the underlying data as well as changes in compilation methodology. The table below summarises significant revisions and breaks in time series.

GU	Implementation	Effective	Approximate size o	f Explanation
	date	date	revision or break	Explanation
Banks' international claims	Dec 2016	Q4 2015	+ \$1.0 trn	China and Russia started reporting the LBS (see <u>Dec 2016 <i>BIS Quarterly Review</i>)</u>
Credit to non-residents, by currency of denomination	Dec 2016	Q2 2012	– \$160 bn (of which, USD: –\$155 bn)	US revised its reporting population for the LBS (see <u>Oct 2016 statistical release</u>)
Credit to non-residents, by currency of denomination	Feb 2017	Q4 2015	+ \$0.6 trn (of which, USD: +\$0.5 trn)	China and Russia started reporting the LBS (see <u>Dec 2016 <i>BIS Quarterly Review</i>)</u>
Credit to non-residents, by currency of denomination	Feb 2017	Q1 2000	+ \$120 bn (of which, USD: –)	Estimates added for local loans to US residents denominated in EUR and JPY
Credit to non-residents, by currency of denomination	Feb 2017	Q1 2000	-	Currency for amounts in EUR and JPY changed from USD to national currency
Credit to non-residents, by currency of denomination	Sep 2017	Q1 2000	+ \$65 bn (of which, USD: + \$33 bn)	IDS based on all ultimate risk sectors, international markets
Credit to non-residents, by currency of denomination	Sep 2017	Q2 2000–Q4 2009	– \$32 bn (of which, USD: – \$37 bn)	Replaced national data local loan proxy for China with <i>nonrepllfx</i> between Q2 2000 and Q4 2009.
Credit to non-residents, by currency of denomination	Sep 2017	Q1 2010–Q3 2015	– \$74 bn (of which, USD: – \$74 bn)	Reallocated national data on Chinese overseas loans from China to the rest of the world.
Credit to non-residents, by currency of denomination	Sep 2017	Q4 2015	– \$365 bn (of which, USD: – \$292 bn)	Excluded national data on overseas loans for China, as these are reported in the LBS as of Q4 2015.
Credit to China, by currency of denomination	Sep 2017	Q1 2010	+\$253 bn (of which, USD: +\$253 bn)	National data on local loans in foreign currency became available for China
Credit to Chinese Taipei, by currency of denomination	Sep 2017	Q4 2000	+\$20 bn (of which, USD: +\$17 bn)	Chinese Taipei started reporting the LBS
Credit to Indonesia, by currency of denomination	Sep 2017	Q4 2010	+\$16 bn (of which, USD: +\$16 bn)	Indonesia started reporting the LBS
Credit to Russia, by currency of denomination	Y Sep 2017	Q4 2015	+\$156 bn (of which, USD: +\$137 bn)	Russia started reporting the LBS (see <u>Dec</u> 2016 BIS Quarterly Review)
Credit to non-residents, by currency of denomination	Apr 2019	Q1 2000	–\$31 (of which, USD: –)	Revised calculations for euro area local loans in foreign currency.
Foreign currency debt in JPY	Jun 2019	Q1 2019	–\$16 trn	Adjusted the series for selected regions (world excluding Japan, EM, Africa and Middle East, EM Asia and Pacific, and China) prior to Q4 2014 to eliminate breaks.

GLI	Implementation date	Effective date	Approximate size of revision or break	Explanation		
Credit to non-residents, by currency of denomination	Dec 2022	Whole time- series	+\$1.3 trn (of which, USD: +\$1.2 trn) for recent periods	The country grouping emerging market and developing economies has been aligned with the country classification in the BIS Annual Economic Report, as detailed <u>here</u> .		
Banks' claims	Dec 2022	Whole time series		Data on Colombia, Israel and Luxembourg have been added to the subregions.		
nonrepllfx = estimated FX denominated local loans to non-banks, proxied by cross-border loans to banks in China.
