 - Economies of scale
 - Network effects
- Centralized entity performs post-trade activities
- Gains access to valuable information to intermediaries
 - Market data by platforms
- Value of transparency in decentralized markets
 - TRACE

Goal of Paper

Goal of Paper

1 Construct model in which

- Dealers make markets, subject to liquidity cost and adverse selection
- Trading in interdealer market outcomes is endogenous

Goal of Paper

1 Construct model in which

- Dealers make markets, subject to liquidity cost and adverse selection
- Trading in interdealer market outcomes is endogenous

2 Main questions

- How is interdealer market liquidity determined?
- How does post-trade information disclosure affect liquidity and efficiency?
- What disclosure environment might a strategic platform choose?

Main Results

Main Results

1 Feedback between market liquidity and interdealer liquidity

Main Results

- 1 Feedback between market liquidity and interdealer liquidity
- 2 Effect of Post-trade disclosure
 - Perfect disclosure improves welfare
 - Nonmonotonic effect of disclosure

Main Results

- 1 Feedback between market liquidity and interdealer liquidity
- 2 Effect of Post-trade disclosure
 - Perfect disclosure improves welfare
 - Nonmonotonic effect of disclosure
- 3 Strategic platform
 - Endogenize disclosure environment
 - Chooses disclosure that maximizes adverse selection

Model

- Three dates $t = 1, 2, 3$
- Two types of risk neutral agents
 - Measure 1 of dealers $i \in [0, 1]$
 - Measure 1 of traders $j \in [0, 1]$

Tiered Trading Structure

Tiered Trading Structure

- 1 “Market-making” stage. Dealer to Trader.

Tiered Trading Structure

- 1 **“Market-making” stage.** Dealer to Trader.
- 2 **“Interdealer” stage.** Dealer to Dealer.

Asset Value

Asset Value

- Asset has (unknown) value v

$$v = \begin{cases} \bar{v} + x & \text{w.p. } \frac{1}{2} \\ \bar{v} - x & \text{w.p. } \frac{1}{2} \end{cases}$$

Asset Value

- Asset has (unknown) value v

$$v = \begin{cases} \bar{v} + x & \text{w.p. } \frac{1}{2} \\ \bar{v} - x & \text{w.p. } \frac{1}{2} \end{cases}$$

- Trader j valuation v_j

Asset Value

- Asset has (unknown) value v

$$v = \begin{cases} \bar{v} + x & \text{w.p. } \frac{1}{2} \\ \bar{v} - x & \text{w.p. } \frac{1}{2} \end{cases}$$

- Trader j valuation v_j
 - v_j *privately* observed

Asset Value

- Asset has (unknown) value v

$$v = \begin{cases} \bar{v} + x & \text{w.p. } \frac{1}{2} \\ \bar{v} - x & \text{w.p. } \frac{1}{2} \end{cases}$$

- Trader j valuation v_j
 - v_j *privately* observed
 - $v_j = v + d_j$ where $d_j \sim U[-D, D]$

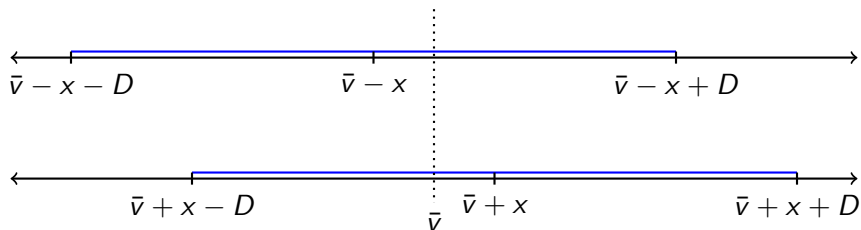

Asset Value

- Asset has (unknown) value v

$$v = \begin{cases} \bar{v} + x & \text{w.p. } \frac{1}{2} \\ \bar{v} - x & \text{w.p. } \frac{1}{2} \end{cases}$$

- Trader j valuation v_j
 - v_j *privately* observed
 - $v_j = v + d_j$ where $d_j \sim U[-D, D]$
 - D captures dispersion in private value

Traders' Valuation of Asset

Market-Making $t = 1$

Market-Making $t = 1$

- Each dealer randomly matched to one trader

Market-Making $t = 1$

- Each dealer randomly matched to one trader
- Dealer i chooses bid-ask offer $(\bar{v} - \delta_i, \bar{v} + \delta_i)$

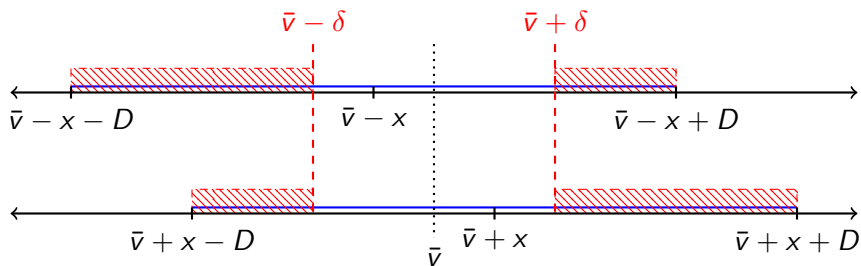

Market-Making $t = 1$

- Each dealer randomly matched to one trader
- Dealer i chooses bid-ask offer $(\bar{v} - \delta_i, \bar{v} + \delta_i)$
- Trader j accepts
 - bid offer if $v_j < \bar{v} - \delta_i$
 - ask offer if $v_j \geq \bar{v} + \delta_i$

Market-Making $t = 1$

- Each dealer randomly matched to one trader
- Dealer i chooses bid-ask offer $(\bar{v} - \delta_i, \bar{v} + \delta_i)$
- Trader j accepts
 - bid offer if $v_j < \bar{v} - \delta_i$
 - ask offer if $v_j \geq \bar{v} + \delta_i$
 - reject otherwise

Market-Making and Likelihood of Trade

Dealer Positions after Market-Making

- Each dealer's position $\{-1, 0, 1\}$

Dealer Positions after Market-Making

- Each dealer's position $\{-1, 0, 1\}$
 - “long dealer” if 1
 - “neutral dealer” if 0
 - “short dealer” if -1

Dealer Positions after Market-Making

- Each dealer's position $\{-1, 0, 1\}$
 - “long dealer” if 1
 - “neutral dealer” if 0
 - “short dealer” if -1

- Dealer type is *private*

Interdealer Trading at $t = 2$

- Dealers randomly matched to each other

Interdealer Trading at $t = 2$

- Dealers randomly matched to each other
- With equal probability, one dealer i makes ultimatum offer (σ, P^d)

Interdealer Trading at $t = 2$

- Dealers randomly matched to each other
- With equal probability, one dealer i makes ultimatum offer (σ, P^d)
 - $\sigma \in \{buy, sell, no\ trade\}$
 - P^d transaction price

Post Trade

Post Trade

- Dealer are members of central counterparty (CCP)

Post Trade

- Dealer are members of central counterparty (CCP)
- Each dealer i must:
 - 1 Report date 1 and 2 trades to CCP
 - 2 After date 2, contribute capital proportional to net position $x_i \in \{-2, -1, 0, 1, 2\}$.

Post Trade

- Dealer are members of central counterparty (CCP)
- Each dealer i must:
 - 1 Report date 1 and 2 trades to CCP
 - 2 After date 2, contribute capital proportional to net position $x_i \in \{-2, -1, 0, 1, 2\}$.
- Dealer i incurs cost $\Delta \cdot |x_i|$.
- Δ opportunity cost of capital

Timeline

Timeline

$t = 1$ Dealers make markets for traders. Trades submitted to CCP.

Timeline

- $t = 1$ Dealers make markets for traders. Trades submitted to CCP.
- $t = 2$ Dealers trade with dealers. Trades submitted to CCP. CCP demands capital from dealers. Dealers incur liquidity cost.

Timeline

- $t = 1$ Dealers make markets for traders. Trades submitted to CCP.
- $t = 2$ Dealers trade with dealers. Trades submitted to CCP. CCP demands capital from dealers. Dealers incur liquidity cost.
- $t = 3$ CCP settles all positions, returns capital. Payoffs realized.

Timeline

- $t = 1$ Dealers make markets for traders. Trades submitted to CCP.
- $t = 2$ Dealers trade with dealers. Trades submitted to CCP. CCP demands capital from dealers. Dealers incur liquidity cost.
- $t = 3$ CCP settles all positions, returns capital. Payoffs realized.

Solution concept: Symmetric-strategy PBE

Market Making Strategies

Bid-ask spread δ_i

Market Making Strategies

Bid-ask spread δ_i

- Profits conditional on trade

Market Making Strategies

Bid-ask spread δ_i

- Profits conditional on trade
- Likelihood that trader accepts offer

Market Making Strategies

Bid-ask spread δ_i

- Profits conditional on trade
- Likelihood that trader accepts offer
- Beliefs on v conditional on trader accepting offer

Market Making Strategies

Bid-ask spread δ_i

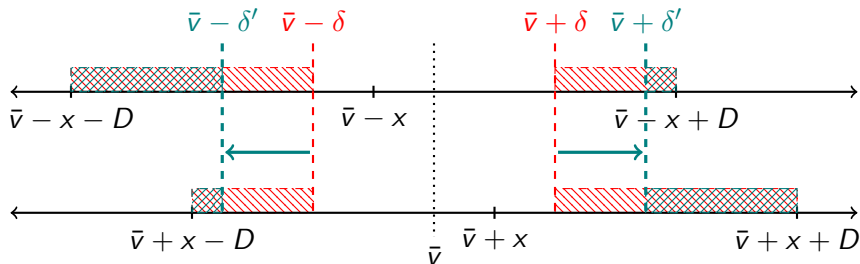

- Profits conditional on trade
- Likelihood that trader accepts offer
- Beliefs on v conditional on trader accepting offer
 - \uparrow if trader buys
 - \downarrow if trader sells

Market Making Strategies

Market-making strategies:

- **Partially revealing offer** if he chooses a $\delta_i \in (0, D - x)$;
 - δ_i increases
 - Probability of trade \downarrow
 - More precise beliefs of v
- **Fully revealing offer** if he chooses a $\delta_i \geq D - x$.

Increasing Bid-Ask Spread

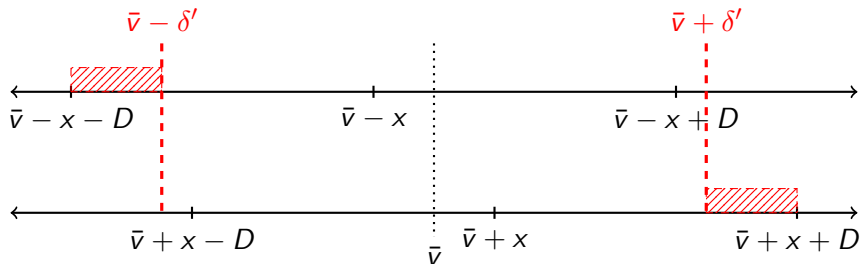

Market Making Strategies

Market-making strategies:

- **Partially revealing offer** if he chooses a $\delta_i \in (0, D - x)$;
- **Fully revealing offer** if he chooses a $\delta_i \geq D - x$.
 - Probability of trade \downarrow
 - *Fully reveals* true value of v

Fully Revealing Market-Making

Interdealer Markets

- Interdealer trading depends on the set of dealer types
- Given set of long, short, neutral dealers, what happens?

Interdealer Markets with Identical δ_i

Interdealer Markets with Identical δ_i

- Suppose all dealers chose $\hat{\delta}$

Interdealer Markets with Identical δ_i

- Suppose all dealers chose $\hat{\delta}$
- Distribution of dealers
 - $\frac{D-x-\hat{\delta}}{2D}$ long if $v = \bar{v} + x$ and $\frac{D+x-\hat{\delta}}{2D}$ if $v = \bar{v} - x$
 - $\frac{D+x-\hat{\delta}}{2D}$ short if $v = \bar{v} + x$ and $\frac{D-x-\hat{\delta}}{2D}$ if $v = \bar{v} - x$
 - $\frac{\hat{\delta}}{D}$ neutral

Interdealer offer strategy with Identical δ_i

Interdealer offer strategy with Identical δ_i

- Consider long dealer that makes offer to sell

Interdealer offer strategy with Identical δ_i

- Consider long dealer that makes offer to sell
- Receiving dealers infer sell offer made by long dealer

Interdealer offer strategy with Identical δ_i

- Consider long dealer that makes offer to sell
- Receiving dealers infer sell offer made by long dealer
- Offset position by selling asset \rightarrow avoid liquidity cost Δ

Gains from Trade in Interdealer Market

- The reservation price of a receiving dealer of type θ :

$$E[v|\text{match between long and } \theta\text{-type dealer}] + \begin{cases} \Delta & \text{if } \theta = s \\ -\Delta & \text{if } \theta = l, n \end{cases}$$

Gains from Trade in Interdealer Market

- The reservation price of a receiving dealer of type θ :

$$E[v|\text{match between long and } \theta\text{-type dealer}] + \begin{cases} \Delta & \text{if } \theta = s \\ -\Delta & \text{if } \theta = l, n \end{cases}$$

- Gains from trade arise *only* when both dealers offset position
- Trade with other types “transfers” liquidity cost

Gains from Trade in Interdealer Market

- The reservation price of a receiving dealer of type θ :

$$E[v|\text{match between long and } \theta\text{-type dealer}] + \begin{cases} \Delta & \text{if } \theta = s \\ -\Delta & \text{if } \theta = l, n \end{cases}$$

- Gains from trade arise *only* when both dealers offset position
- Trade with other types “transfers” liquidity cost
- \therefore Long dealer maximizes payoff by offering short reservation price

Interdealer Trading with $\hat{\delta} < D - x$

Interdealer Trading with $\hat{\delta} < D - x$

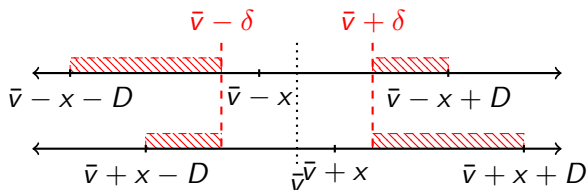

- $\hat{\delta} < D - x \Rightarrow$ positive measure of long and short dealers

Interdealer Trading with $\hat{\delta} < D - x$

- $\hat{\delta} < D - x \Rightarrow$ positive measure of long and short dealers
- Interdealer trading *only* occurs between long-short dealers

Interdealer Trading with $\hat{\delta} < D - x$

- $\hat{\delta} < D - x \Rightarrow$ positive measure of long and short dealers
- Interdealer trading *only* occurs between long-short dealers
- **All trades with surplus occur**

Market Segmentation

Market Segmentation

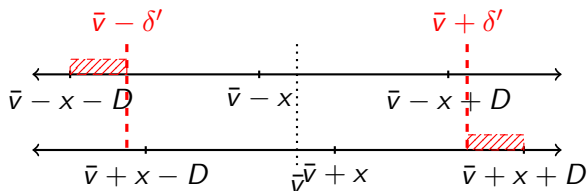

- $\hat{\delta} > D - x \Rightarrow$ long and short dealers do not coexist.

Market Segmentation

- $\hat{\delta} > D - x \Rightarrow$ long and short dealers do not coexist.
- No gains from trade with any dealer matches

Market Segmentation

- $\hat{\delta} > D - x \Rightarrow$ long and short dealers do not coexist.
- No gains from trade with any dealer matches
- No interdealer trading occurs.

Interdealer Markets

Interdealer Markets

- Interdealer trading occurs $\Leftrightarrow \delta^* < D - x$

Interdealer Markets

- Interdealer trading occurs $\Leftrightarrow \delta^* < D - x$
- When do dealers choose partially revealing offers in equilibrium?

Incentives to Deviate to Larger δ_i

Incentives to Deviate to Larger δ_i

Dealer's marginal interdealer payoff given other dealers choose $\hat{\delta}$

Incentives to Deviate to Larger δ_i

Dealer's marginal interdealer payoff given other dealers choose $\hat{\delta}$

$$V_{\theta}(\delta_i, \hat{\delta}) = \underbrace{\left(\sum_v P(v|\theta) P(\text{match with opposite dealer} | v, \theta) \right) \Delta}_{\text{gains from netting}} + \underbrace{\left(\sum_v P(v|\theta) P(\text{match with opposite dealer} | v, \theta) \right) (\bar{v} - E_i[v | \text{trade}])}_{\text{information rents}}$$

Expected Payoffs at $t = 1$

$$\begin{aligned}\Pi_i(\delta_i, \hat{\delta}) &= \underbrace{P(\gamma_j(P^b, P^a) = \text{accept} | \delta_i) \cdot (\bar{v} + \delta_i - E[v | \delta_i] - \Delta)}_{\equiv A, \text{ market-making payoff}} \\ &+ \underbrace{\sum_{\theta} P(\theta_i = \theta | \delta_i) \cdot V_{\theta}(\delta_i, \hat{\delta})}_{\equiv B, \text{ interdealer payoff}}\end{aligned}$$

Two Types of Equilibria

Result.

- For $x < x^{trade}$, equilibrium with interdealer trading exists;
- For $x > x^{seg}$, equilibrium with market segmentation exists.

Measuring Market Liquidity

- measure μ of offers accepted by traders
- For $x \in (x^{seg}, x^{trade})$, interdealer trading improves market liquidity
- Comparative statics of market liquidity μ
 - decreases in Δ
 - decreases in x
 - increases in D

Post-Trade Information Disclosure

Post-Trade Information Disclosure

- Gains to become more informed break down interdealer trading.

Post-Trade Information Disclosure

- Gains to become more informed break down interdealer trading.
- Interdealer liquidity $\downarrow \Rightarrow$ dealers' liquidity provision \downarrow

Post-Trade Information Disclosure

- Gains to become more informed break down interdealer trading.
- Interdealer liquidity $\downarrow \Rightarrow$ dealers' liquidity provision \downarrow
- Efficiency can be improved by limiting private benefits

Post-Trade Information Disclosure

- Gains to become more informed break down interdealer trading.
- Interdealer liquidity $\downarrow \Rightarrow$ dealers' liquidity provision \downarrow
- Efficiency can be improved by limiting private benefits
- Gains from **post-trade information disclosure**.

Extension with Post-Trade Information Disclosure

At date 2, CCP publicly discloses anonymized trades in date 1.

Value of Post-Trade Information

Result. Suppose that a dealer observes the set of successful trades made at $t = 1$. Then, the dealer perfectly infers the true value of v .

Effect of Post-Trade Disclosure

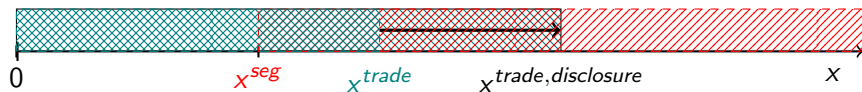

$$V_{\theta}(\delta_i, \hat{\delta}) = \frac{1}{2} \left(\underbrace{\sum_v P(v|\theta) P(\text{match with opposite dealer} | v, \theta)}_{\text{gains from netting}} \right) 2\Delta$$

$\underbrace{0}_{\text{information rents}}$

Equilibrium Under Disclosure

Result. Under disclosure, equilibrium with interdealer trading exists if $x < x^{trade, disclosure}$.

- 1 Interdealer trading occurs for larger x
- 2 Tighter bid-ask spreads

Key Takeway from Full Post-Trade Disclosure

Market efficiency increases with perfect disclosure of information

Key Takeway from Full Post-Trade Disclosure

Market efficiency increases with perfect disclosure of information

- Interdealer trading occurs for greater x

Key Takeway from Full Post-Trade Disclosure

Market efficiency increases with perfect disclosure of information

- Interdealer trading occurs for greater x
- Transparency \Rightarrow dealers increase liquidity provision

Partial Post-Trade Disclosure

Partial Post-Trade Disclosure

- Dealers may be asymmetrically informed

Partial Post-Trade Disclosure

- Dealers may be asymmetrically informed
 - Rational inattention bars all dealers from incorporating info in time

Partial Post-Trade Disclosure

- Dealers may be asymmetrically informed
 - Rational inattention bars all dealers from incorporating info in time
 - Selective disclosure to subset of dealers

General Disclosure Environment with λ

- At date 2, fraction $\lambda \in [0, 1]$ of dealers become randomly informed.

General Disclosure Environment with λ

- At date 2, fraction $\lambda \in [0, 1]$ of dealers become randomly informed.
- Earlier cases:
 - No disclosure ($\lambda = 0$)
 - Perfect disclosure ($\lambda = 1$)

Case: $\lambda \approx \epsilon$

- Small deviation from no disclosure case ($\lambda = 0$)
- When λ very small

Case: $\lambda \approx \epsilon$

- Small deviation from no disclosure case ($\lambda = 0$)
- When λ very small
- Almost all dealers are “uninformed” in interdealer markets
- Most matches in interdealer between uninformed

Case: $\lambda \approx \epsilon$

- Small deviation from no disclosure case ($\lambda = 0$)
- When λ very small
- Almost all dealers are “uninformed” in interdealer markets
- Most matches in interdealer between uninformed
- \therefore Facilitate trades between uninformed

Case: $\lambda \approx 1 - \epsilon$

- Small deviation from perfect disclosure case ($\lambda = 1$)
- When λ very large

Case: $\lambda \approx 1 - \epsilon$

- Small deviation from perfect disclosure case ($\lambda = 1$)
- When λ very large
- Almost all dealers are “informed” in interdealer markets
- Most matches in interdealer between informed dealers

Case: $\lambda \approx 1 - \epsilon$

- Small deviation from perfect disclosure case ($\lambda = 1$)
- When λ very large
- Almost all dealers are “informed” in interdealer markets
- Most matches in interdealer between informed dealers
- \therefore Facilitate trades between informed

Equilibrium with λ

- For $\lambda \in [0, \bar{\lambda}]$,
 - Dealers trade at “uninformed prices”
 - Informed dealers extract information rents
- For $\lambda \in (\bar{\lambda}, 1]$,
 - Dealers trade at “informed prices”
 - Uninformed dealers use prices to screen

Nonmonotonicity with λ

Result. When x and D are sufficiently large, liquidity is nonmonotonic over the interval of $\lambda \in (0, 1)$.

Competing Effects with Partial Disclosure

- **Information Effect.** As λ increases, more dealers become informed
- **Adverse Selection Effect.** Uninformed dealers face adverse selection

Competing Effects with Partial Disclosure

- **Information Effect.** As λ increases, more dealers become informed
- **Adverse Selection Effect.** Uninformed dealers face adverse selection

- For small λ , adverse selection cost outweighs benefits of information

Competing Effects with Partial Disclosure

- **Information Effect.** As λ increases, more dealers become informed
- **Adverse Selection Effect.** Uninformed dealers face adverse selection

- For small λ , adverse selection cost outweighs benefits of information
- As λ increases, benefits of information dominate

Competing Effects with Partial Disclosure

- **Information Effect.** As λ increases, more dealers become informed
- **Adverse Selection Effect.** Uninformed dealers face adverse selection

- For small λ , adverse selection cost outweighs benefits of information
- As λ increases, benefits of information dominate
- Intermediate λ worse than all or *no* information

Strategic Platform

Strategic Platform

- Potential reason for $\lambda < 1$ is due to costly access
- Platforms may charge dealers for timely access to info

Strategic Platform

- Potential reason for $\lambda < 1$ is due to costly access
- Platforms may charge dealers for timely access to info
- Endogenize λ

Extension: Strategic Platform

At date 2, Platform chooses cost c at which dealer can observe trades.

Determination of Cost c

Determination of Cost c

- Choose c to maximize $c \cdot \lambda(c)$

Determination of Cost c

- Choose c to maximize $c \cdot \lambda(c)$
- If c sufficiently low \rightarrow all dealers acquire info ($\lambda = 1$)

Determination of Cost c

- Choose c to maximize $c \cdot \lambda(c)$
- If c sufficiently low \rightarrow all dealers acquire info ($\lambda = 1$)
- Alternatively, platform may set c to *maximize value of information*
 - adverse selection greatest at $\bar{\lambda}$
 - can charge highest c

Determination of Cost c

- Choose c to maximize $c \cdot \lambda(c)$
- If c sufficiently low \rightarrow all dealers acquire info ($\lambda = 1$)
- Alternatively, platform may set c to *maximize value of information*
 - adverse selection greatest at $\bar{\lambda}$
 - can charge highest c

Result. For sufficiently large x and D , a strategic platform selects some cost $c^\diamond > 0$ that **induces** $\bar{\lambda}$.

What do platforms do?

- Platforms regularly sell information products

What do platforms do?

- Platforms regularly sell information products
 - Asymmetric access to relevant market info
 - Post-trade info access in options market
 - Special access order types that reveal private info

What do platforms do?

- Platforms regularly sell information products
 - Asymmetric access to relevant market info
 - Post-trade info access in options market
 - Special access order types that reveal private info
- SEC ruling against exchanges over raising market-data fees.

What do platforms do?

- Platforms regularly sell information products
 - Asymmetric access to relevant market info
 - Post-trade info access in options market
 - Special access order types that reveal private info
- SEC ruling against exchanges over raising market-data fees.
- Market participants' concern when competing banks operate post-trade platforms

Conclusion

- Develop model of decentralized market with tiered trading structure
- Dealers dealt with adverse selection and liquidity costs

Conclusion

- Develop model of decentralized market with tiered trading structure
- Dealers dealt with adverse selection and liquidity costs

Main Takeaways:

- Link between market liquidity and interdealer liquidity
- Welfare gains from perfect disclosure
- Nonmonotonic effect of disclosure
- Suboptimal outcome with strategic platform
