

## CROSS-COUNTRY FIRM-BANK EXPOSURES: WHAT CAN WE LEARN FROM PUBLIC DATA?

## INTRODUCTION. POST-GFC DATA NEEDS

- Post-GFC data needs on bank-firm interlinkages -the GFC was a major banking crisis transmitted worldwide.
- Data availability has improved thanks to DGI: IDH –top 30 banks, highly confidential, credit and liability exposures, I-A.
- Besides central banks have mobilized their country-level data; limits to data sharing often prevent pooling them
- However some data needs persist: cross-country (I-I) bank-firm exposures, needed for policy evaluation/risk assessment.

## INTRODUCTION. POST-GFC DATA NEEDS

- Research question: can we define (I-I) bank-firm exposures from public loan data (ie large loans reported by banks, and disseminated by commercial data providers)?
- Our paper: use lenders and borrowers' common identifiers to match loans to firm/bank-level datasets ; use maturity date to define:
  - Lending-relationships: **exist if there is an outstanding loan**
  - Credit exposures: **size of the exposure (US mn)**
- Main conclusion: bank-firm lending relationships seem reliable; credit exposures require further adjustments –work ahead.

## MEASURING CROSS-COUNTRY FIRM-BANK EXPOSURES.

- **Key figures:** 282,912 loans (not only syndicated), 1983-2018:
  - Average loan is 300 USD mn (median 50 USD mn); USD loans account for 60% of the total
  - Type liability: 50% are term loans; 40% are credit lines; the remaining are project finance, bridge loans.
- **Borrowers:** 78,443 issuers, with significant dispersion; 60,020 at consolidated level, based in 119 countries; top 5 are US, JP, UK, CA, AU (44%, 13%, 7%, 3%, 2%). Focus on NFC.
- **Lenders:** 16,107 lenders (any role in the deal), with remarkable concentration among banks; 549 account for 75% of all deals, ie 1,3 mn lending relationships.

# MEASURING CROSS-COUNTRY FIRM-BANK EXPOSURES.

- **What we do?** We compute outstanding loans of bank  $i$  to firm  $j$  at time  $t$ , using the original maturity of the loan; then we define:
  - Lending relationships: exists if there is an outstanding loan.
  - Credit exposures: size of the exposure (US mn).
- **How we do it?** We match borrowers/lenders to firm/bank level data using their common identifiers (eg LEI); this has benefits:
  - Efficient
  - Credible
  - Economic meaning
  - Cross-border

## MEASURING CROSS-COUNTRY FIRM-BANK EXPOSURES. LIMITATIONS

1. No liability-side exposures (eg corporate deposits on banks);
2. No information on important asset classes, such as small loans, trade finance, derivatives, guarantees.
3. Sample of firms is biased towards large companies.
4. We do not adjust for secondary market transactions; we assume a bullet payment, and no amendments. No information on credit hedges.

Bottom-line: public data will never be as good as supervisory data; but allows measuring cross-country, cross-border, exposures

# MAIN RESULTS

## 1. Lending relationships

- Bank\*Firm relationships over time
- Loan portfolio risk analysis

## 2. Credit exposures, term loans:

- Top 10 bank-firm exposures, end-2017
- Banks' exposures to distressed firms –eg Toys "R" Us '17

## MAIN RESULTS (I). LENDING RELATIONSHIPS

- A lending relationship from bank  $i$  to firm  $j$  at year  $t$  exists when there is an outstanding loan.

Lending relationships based on syndicated loans data

- However: banks might have renegotiated debt/sold them (Irani, Iyer, Meisenzahl and Peydro, 2018).

## CONCLUSIONS

- We construct (I-I) bank-firm exposures using public loan data: lending relationships and credit exposures.
- Our main contribution is to use lenders/borrowers common identifiers; we gain accuracy and do not lose data.
- Not easy to check the quality of results. Our guess is that:
  - Results on lending relationships are good enough for economic analysis.
  - The assumptions required to estimate credit exposures are too strong (ie no risk transfers/risk mitigation).
- Potential work ahead: further refine credit exposures adjusting for secondary market sales or loan contract amendments.

## MEASURING CROSS-COUNTRY FIRM-BANK EXPOSURES. METHODOLOGICAL CHOICES

1. Borrowers are consolidated at the ultimate parent level [as long it is a non-financial firm]: **consolidation of SPVs is not controversial; but some affiliates could be financially independent.**
2. Lenders are consolidated up to the level of the first listed entity: **since we assume that listed banks are standalone.**
3. The definition of a “cross-border exposure” differs from BIS IBS (which is based on issuers/lenders location) as a result of [1] and [2] .
4. Loan allocation rule between arrangers and others is ad-hoc and reflects lack of data. Further work could be done.
