

Long series on total credit and domestic bank credit to the private non-financial sector

Documentation on data

Last updated 24 November 2023

Download of credit series:

[Data \(XLSX\)](#)

The BIS has constructed long series on credit to the private non-financial sector for 44 economies, both advanced and emerging. Credit is provided by domestic banks, all other sectors of the economy and non-residents. The “private non-financial sector” includes *non-financial corporations* (both private-owned and public-owned), *households* and *non-profit institutions serving households* as defined in the System of National Accounts 2008. In terms of financial instruments, credit covers *loans* and *debt securities*. The series have quarterly frequency and capture the outstanding amount of credit at the end of the reference quarter. Table 1 below shows the list of financial instruments, borrowers and lenders covered by the series.

The BIS consulted its member central banks in this endeavour, and is very thankful for the assistance received.¹ The BIS has made every reasonable effort to ensure that the long series on credit are accurate, but no guarantees are made.

To encompass as long a period as possible, the construction of the long series required combining data from several sources, such as the financial accounts by institutional sector, the balance sheets of domestic banks, international banking statistics, and the balance sheets of non-bank financial institutions. In turn, some of these statistics were compiled in past periods according to earlier methodological frameworks (eg the System of National Accounts 1968, which was replaced by the System of National Accounts 1993). Where original data were published at annual frequency, the intra-annual observations were interpolated.

The combination of different sources and data from various methodological frameworks resulted in breaks in the series. The BIS is therefore, in addition, publishing a second set of series adjusted for breaks, which covers the same time span as the unadjusted series. The break-adjusted series are the result of the BIS’s own calculations, and were obtained by adjusting levels through standard statistical techniques described in the [special feature on the long credit series](#) of the March 2013 issue of the *BIS Quarterly Review*. Since September 2015 data are also available in US dollars and as a percentage of GDP.²

The data for each country include (i) credit to private non-financial sectors by domestic banks and (ii) total credit to private non-financial sectors. Moreover, for most countries, total credit is broken down into (iii) credit to non-financial corporations and (iv) credit to households and non-profit institutions serving households. Tables 2 and 3 below contain more information about the methodology followed in the compilation of each time series, as well as links to websites where the most recent national data can be found. For more information, see the above-mentioned article about the long credit series.

Since March 2016, the BIS has added the regional aggregates in the data set. Four aggregates are available: G20, advanced economies, emerging market economies and all reporting economies.³ The data in billions of US

¹ The statistical offices in Norway and Sweden also provided assistance.

² Four-quarter moving sum of nominal GDP is used. When historical data are insufficient for quarterly figures for nominal GDP, annual figures are converted to quarterly using linear interpolation.

³ G20 comprises Argentina, Australia, Brazil, Canada, China, the euro area, India, Indonesia, Japan, Korea, Mexico, Russia, Saudi Arabia, South Africa, Türkiye, the United Kingdom and the United States. Advanced economies comprise Australia,

dollars are calculated using market exchange rates and the percentages of GDP are calculated based on conversion to US dollars at market and at purchasing power parity (PPP) exchange rates.

This data set on credit to private non-financial sectors combined with the one on general government debt can provide a useful picture of the aggregated indebtedness of all non-financial sectors.

Listed below are the details of the methodology followed in the compilation of the long series, as well as links to websites where the most recent national data can be found. The data set is updated at the end of each quarter. Any use of the credit series should be cited as follows "Source: BIS total credit statistics".

Canada, Denmark, the euro area, Japan, New Zealand, Norway, Sweden, Switzerland, the United Kingdom and the United States. Emerging market economies comprise Argentina, Brazil, Chile, China, Colombia, the Czechia, Hong Kong SAR, Hungary, India, Indonesia, Israel, Korea, Malaysia, Mexico, Poland, Russia, Saudi Arabia, Singapore, South Africa, Thailand and Türkiye. All reporting economies comprise the economies listed under the advanced and emerging market economies.

Characteristics of credit data¹

Table 1

	Total credit	Domestic bank credit	Cross-border bank credit

Trade credit and advances	–	–	✓
Other accounts receivable/payable	–	–	–
Currency ⁴	National currency	National currency	National currency
Valuation method⁵			
Loans	Nominal value	Nominal value	Nominal value
Debt securities ²	Market value ⁶	Market value	Market value
Intra-sector consolidation	Not consolidated	No intra-sector transactions ⁷	No intra-sector transactions ⁷

¹ Credit provided by other financial institutions follows the same classification as domestic bank credit, except for the lender coverage. ² Debt securities include bonds and short-term paper. ³ Not adjusted for securitisation. ⁴ Exchange rate movements can affect reported levels of credit as loans, particularly cross-border ones, can be denominated in multiple currencies. ⁵ The System of National Accounts 2008, ideally, recommends valuing liabilities at market value. Credit is labelled at market value considering that debt securities are recorded at market value. Due to the absence of observable market prices, loans are measured at nominal value. ⁶ For the United States, face value. ⁷ Consolidation is not an issue as there are no intra-sector transactions. Only lending relationships between the banking and the private non-financial sector are captured.
